

EXTENDS *TLC, Integers, FiniteSets, Sequences, Reals*

CONSTANTS *PRODUCTS, APPS, IDs, GATEAPPS*

ASSUME *Cardinality(APPS) > 0*

$PT \triangleq$  INSTANCE *PT*

$set ++ item \triangleq set \cup \{item\}$

$set -- item \triangleq set \setminus \{item\}$

In shopping list, the product is in fact the identifier. Any item could have an information for how much of a product one wants to buy (not relevant in this specification).

$ShopyItems \triangleq [id : PRODUCTS, bought : BOOLEAN]$

$ADD\_ACTION \triangleq$  "add"

$RM\_ACTION \triangleq$  "rm"

$SET\_BOUGHT\_ACTION \triangleq$  "set\_bought"

$REQ\_SYNC\_ACTION \triangleq$  "req\_sync"

$RESP\_SYNC\_ACTION \triangleq$  "resp\_sync"

$END\_SYNC\_ACTION \triangleq$  "end\_sync"

Actions is the set of all possible actions in the system.

$Actions \triangleq \{$   
 $ADD\_ACTION,$   
 $RM\_ACTION,$   
 $SET\_BOUGHT\_ACTION,$   
 $REQ\_SYNC\_ACTION,$   
 $RESP\_SYNC\_ACTION,$   
 $END\_SYNC\_ACTION$   
 $\}$

$SyncActions \triangleq \{REQ\_SYNC\_ACTION, RESP\_SYNC\_ACTION\}$

*SyncMsgs* is the set of all possible messages sent for synchronisation of shopy lists.

$SyncMsgs \triangleq$   
 $[id : IDs,$   
 $app : APPS,$   
 $list : SUBSET ShopyItems,$   
 $mergedList : SUBSET ShopyItems,$   
 $type : SyncActions]$

Messages sent for joining the network.

$JoinRespMsgs \triangleq$   
 $[app : APPS,$   
 $knownHosts : PT!SeqOf(APPS, Cardinality(APPS))]$

$$\text{JoinReqMsgs} \triangleq \\ [app : APPS]$$

Messages sent for notifications about new joiners in the network.

$$\text{JoinNotifMsgs} \triangleq \\ [app : APPS]$$

The spec now depicts a shopping-list *app* where the server *app* manages several users and hence multiple lists of items that synch eventually.

The list contains unique items, thus we use a set.

**--algorithm** *OptiShopyList*

**variable**

whether an *app* is a gate  
 $isGate = [a \in APPS \mapsto a \in GATEAPPS],$   
 one shopping list for all *APPS*  
 $shopyList = [a \in APPS \mapsto \{\}],$   
 sync *shopyList* requests/responses  
 $syncReqQueue = [a \in APPS \mapsto \langle \rangle],$   
 $syncRespQueue = [a \in APPS \mapsto \langle \rangle],$   
 join to network requests/responses  
 $joinReqQueue = [a \in APPS \mapsto \langle \rangle],$   
 $joinRespQueue = [a \in APPS \mapsto \langle \rangle],$   
 new joiner notifications  
 $newJoinerNotif = [a \in APPS \mapsto \langle \rangle],$   
 set of taken *IDs*  
 $takenIDs = \{\};$

**define**

A couple of helpers for shopy-list items

$\text{NewShopyItem}(list) \triangleq$   
 $[id \mapsto (\text{CHOOSE } x \in PRODUCTS : \neg \exists i \in list : x = i.id),$   
 $bought \mapsto \text{FALSE}]$

$\text{ExistingShopyItem}(list) \triangleq \text{CHOOSE } x \in list : \text{TRUE}$

$\text{ExistingNotBoughtShopyItem}(list) \triangleq \text{CHOOSE } x \in list : x.bought = \text{FALSE}$

Helpers for *Sync* messages request/response.

$\text{NewSyncMsg}(id, a, l, ml, t) \triangleq$   
 $[id \mapsto id,$   
 $app \mapsto a,$   
 $list \mapsto l,$   
 $mergedList \mapsto ml,$

$$\begin{aligned}
& type \mapsto t] \\
NewSyncReqMsg(a, l, ml, t) & \triangleq \\
& NewSyncMsg( \\
& \quad (CHOOSE \ i \in \ IDs : \forall \ ti \in \ takenIDs : \ i = \ ti), \\
& \quad a, l, ml, t \\
& ) \\
NewSyncReq(app) & \triangleq \\
& NewSyncReqMsg(app, shopyList[app], \{\}, REQ\_SYNC\_ACTION) \\
NewSyncResp(app, mergeResult, id) & \triangleq \\
& NewSyncMsg(id, app, shopyList[app], mergeResult, RESP\_SYNC\_ACTION)
\end{aligned}$$

Helpers for the decentralized network features.

$$\begin{aligned}
NewJoinReqMsg(app) & \triangleq [app \mapsto app] \\
NewJoinRespMsg(app, hosts) & \triangleq \\
& [app \mapsto app, \\
& \quad knownHosts \mapsto hosts] \\
GateApps & \triangleq \{a \in APPS : isGate[a]\} \\
NewJoinerNotifReq(app) & \triangleq [app \mapsto app] \\
PickGossipFriends(app, knownApps) & \triangleq \\
& LET \ Opposit \triangleq \\
& \quad PT!Index(knownApps, app) + (Len(knownApps) \div 2) - (Len(knownApps) \% 2) \\
& \quad PreviousIndex(i) \triangleq \\
& \quad \quad IF \ Len(knownApps) < 3 \\
& \quad \quad THEN \ 1 \\
& \quad \quad ELSE \ IF \ i = 1 \ THEN \ Len(knownApps) \ ELSE \ i - 1 \\
& \quad NextIndex(i) \triangleq \\
& \quad \quad IF \ Len(knownApps) < 3 \\
& \quad \quad THEN \ Len(knownApps) \\
& \quad \quad ELSE \ IF \ i = Len(knownApps) \ THEN \ 1 \ ELSE \ i + 1 \\
& \quad IN \ \{knownApps[PreviousIndex(Opposit)], knownApps[NextIndex(Opposit)]\}
\end{aligned}$$

Not used, it's an example of how we'd keep the ordering of the responded *knownApps* sequence on joining. If it's used, it should be with small sequences to not generate enormous sets.

$$\begin{aligned}
MergeKnownApps(apps1, apps2) & \triangleq \\
& LET \ AppSeq(n) \triangleq PT!SeqOf(APPS, n) \\
& \quad Contains(appSeq, appItem) \triangleq \\
& \quad \quad Cardinality(PT!Matching(appSeq, appItem)) > 0
\end{aligned}$$

```

This process represents a shopy-list running in one of the several network clients.

Since Opti-shopylist is a decentralized program, the user creates a network of connected instances of Opti-shopylist.

We assume that every client *app* has only one shopy-list.

**fair process** *ClientApp*  $\in APPS$
