

EXTENDS *TLC, Integers, FiniteSets, Sequences*
 CONSTANTS *PRODUCTS, APPS, IDs, GATEAPP*

$PT \triangleq \text{INSTANCE } PT$

$set ++ item \triangleq set \cup \{item\}$
 $set -- item \triangleq set \setminus \{item\}$

In shopping list, the product is in fact the identifier. Any item could have an information for how much of a product one wants to buy (not relevant in this specification).

$ShopyItems \triangleq [id : PRODUCTS, bought : \text{BOOLEAN}]$

$ADD_ACTION \triangleq \text{"add"}$
 $RM_ACTION \triangleq \text{"rm"}$
 $SET_BOUGHT_ACTION \triangleq \text{"set_bought"}$
 $REQ_SYNC_ACTION \triangleq \text{"req_sync"}$
 $RESP_SYNC_ACTION \triangleq \text{"resp_sync"}$
 $END_SYNC_ACTION \triangleq \text{"end_sync"}$

Actions is the set of all possible actions in the system.

$Actions \triangleq \{$
 $ADD_ACTION,$
 $RM_ACTION,$
 $SET_BOUGHT_ACTION,$
 $REQ_SYNC_ACTION,$
 $RESP_SYNC_ACTION,$
 END_SYNC_ACTION
 $\}$

$SyncActions \triangleq \{REQ_SYNC_ACTION, RESP_SYNC_ACTION\}$

$SyncMsgs$ is the set of all possible messages sent for synchronisation of shopy lists.

$SyncMsgs \triangleq$
 $[id : IDs,$
 $app : APPS,$
 $list : \text{SUBSET } ShopyItems,$
 $mergedList : \text{SUBSET } ShopyItems,$
 $type : SyncActions]$

The spec now depicts a shopping-list *app* where the server *app* manages several users and hence multiple lists of items that synch eventually.

The list contains unique items, thus we use a set.

--algorithm *OptiShopyList*

variable

one shopping list for all *APPS*
 $shopyList = [a \in APPS \mapsto \{\}],$
 sync requests for all *APPS*
 $syncReqQueue = [a \in APPS \mapsto \langle \rangle],$
 sync responses for all *APPS*
 $syncRespQueue = [a \in APPS \mapsto \langle \rangle],$
 set of taken *IDs*
 $takenIDs = \{\};$

define

A couple of helpers for shopy-list items

$NewShopyItem(list) \triangleq$
 $\quad [id \mapsto (\text{CHOOSE } x \in PRODUCTS : \neg \exists i \in list : x = i.id),$
 $\quad \quad bought \mapsto \text{FALSE}]$
 $ExistingShopyItem(list) \triangleq \text{CHOOSE } x \in list : \text{TRUE}$
 $ExistingNotBoughtShopyItem(list) \triangleq \text{CHOOSE } x \in list : x.bought = \text{FALSE}$

Helpers for *Sync* messages request/response.

$NewSyncMsg(id, a, l, ml, t) \triangleq$
 $\quad [id \mapsto id,$
 $\quad \quad app \mapsto a,$
 $\quad \quad list \mapsto l,$
 $\quad \quad mergedList \mapsto ml,$
 $\quad \quad type \mapsto t]$
 $NewSyncReqMsg(a, l, ml, t) \triangleq$
 $\quad NewSyncMsg($
 $\quad \quad (\text{CHOOSE } i \in IDs : \forall ti \in takenIDs : i = ti),$
 $\quad \quad a, l, ml, t$
 $\quad \quad)$
 $NewSyncReq(app) \triangleq$
 $\quad NewSyncReqMsg(app, shopyList[app], \{\}, REQ_SYNC_ACTION)$
 $NewSyncResp(app, mergeResult, id) \triangleq$
 $\quad NewSyncMsg(id, app, shopyList[app], mergeResult, RESP_SYNC_ACTION)$

Helpers for the decentralized network features.

$IsGate(app) \triangleq app = GATEAPP$

end define ;

This process represents a shoppy-list running in one of the several offline clients. Several shoppy-lists are running on various *app* processes. Actually, we specify what happens in the system when 2 client apps want to synch their shoppy-list. We assume that every client *app* has only one such list since the user is able to synch any 2 lists together.

fair process *ClientApp* \in *APPS*
